growth, and modulating immune system by binding to ligand

Claim 1; Page 2; 119pp; English.

The invention relates to an isolated cytokine receptor polypeptide designated Ecytori8. The Ecytori8 polypeptides can be expressed by standard recombinant methodology. The polypeptides can be used to inhibit cell proliferation associated with psortasis or tumour growth. The encoding nucleic acids are useful for providing Ecytori8 in vivo by gene therapy techniques. Ecytori8 oligonicleotide probes are useful for in vivo diagnosis, and the Ecytori8 probes and primers can be used to detect and localize Ecytori8 gene expression in tissue samples. The probes are also useful for detecting gross aberrations in chromosoms 1 in which Ecytori8 gene resides. The Ecytori8-polymiciactions in chromosoms 1 in which inhapse-based testing of pulmonary alveolar proteinosis, familial polymorphisms of cytokine receptors. The present sequence represents a human Ecytori8 manto acid sequence.

The invention relates to an isolated cytokine receptor polypeptide designated Zcytor18. The Zcytor18 polypeptides can be expressed by standard recombinant methodology. The polypeptides can be used to inhibit cell proliferation associated with psorlasis or tumour growth. The encoding nucleic acids are useful for providing Zcytor18 in vivo by gene therapy techniques. Zcytor18 oliponucleotide probes are useful for in vivo diagnosis, and the Zcytor18 probes and primers can be used to detect and localize Zcytor18 gene expression in tissue samples. The probes are also useful for detecting gross aberrations in chromosome 3 in which Ecytor18 gene resides. The Zcytor18 polynucleotides can also be used in linkage-based testing of pulmonary alveolar proteinosis, familial periodic fever and erythroleukemia, and arythroleukemia associated with human Zcytor18 splice variant. New cytokine receptor polypeptide designated zcytori8, useful for inhibiting cell proliferation associated with psoriasis or tumor growth, and modulating immune system by binding to endogenous zcytori8 ligand WVIOKIHESOFIIVVCSKGMKYFVDKKNYKHKGGGRGSGKGELFLVAVSAIAEKLRQAKQ 480 61 ASRNSGLYNITFKYDNCTTYLNPVGKHVIADAQNITISQYACHDQVAVTILWSPGALGIE 120 SSSAALSKFIAVYFDYSCEGDVPGILDLSTKYRLMDNLPQLCSHLHSRDHGLQEPGQHTR 540 Indels 14; Gaps 107 FLKGFRVILEELKSEGRQCQQLILKDPRQLNSSFKRTGMESQPFLNWRFETDYFVRVVPF LKPVHSPWAGPIRAVAITVPLVVISAFATLFTVMCRKKQQENIYSHLDEESSESSTYTAA 1 MAPWLQLCSVFFTVNACLNGSQLAVAAGGSGRARGADTCGWRMRAAARPRLCVANEGVGP 181 PSIKNESNYHPFFFRTRACDILLIQPDNLACKPFWKPRNLNISQHGSDMQVSFDHAPHNFG LKPVHSPWAGPIRAVAITVPLVVISAFATLFTVMCRKKQOENIYSHLDEESSESSTYTAA LPRERLRPRPRVFLCYSSKDGQNHMNVVQCFAYFLQDFCGCEVALDLWEDFSLCREGGRE 121 FLKGFRVILBELKSEGROCOOLILKDPKOLNSSFRRTGMESOPFLNMKFETDYFVKVVPF Query Match 97.8%; Score 3925; DB 23; Length 739; Best Local Similarity 98.1%; Pred. The invention describes novel nucleic acids encoding interleukin (IL) 17 receptor like polypeptides useful as vaccines and in gene therapy. These have immunosublatory, anti-inflamatory, anti-dabetic, anti-microbial, immunosuppressive, hepatic, anabolic, anci-elsheimer's, renal, asti-parkinsonian, anti-convulsant, anti-elshematic, dermatological, osteopathic, vascular, cytostatic, anti-leukaemic, anti-infertility and proteins may be used to prevent and treat diseases associated with inappropriate IL-17 receptor like nucleic acids and proteins may be used to prevent and treat diseases associated with inappropriate IL-17 receptor like polypeptide (ILI7nip) expression. These include, for example immune disorders (e.g. inflammation, diabetes and transplant rejection), infections (e.g. hepatitis and septicaemia), weight disorders (e.g. hepatitis and obesity), neuronal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Interleukin 17; hIL-17 receptor like protein; immunomodulatory; and anti-infifammatory; anti-diabetic; immunosuppressive; anti-microbial; hepatic; anabolic; anorectic; anti-alzheimer's; anti-parkinsonian; anti-convulsant; anti-asthmatic; dermatological; renal; osteopathic; vascular; cytostatic; anti-leukaemic; anti-infertility; ophthalmological; hepatitis; anorexis; cacheris; neuronal dysfunction; lung disease; bone disease; pascular disorder; eye disorder; cancer; human.

acids encoding interleukin 17 receptor like polypeptides, for preventing, diagnosing and treating, e.g. leukemla, asthma, s; psoriasis and qlaucoma diabetes, psoriasis and glaucoma Nucleto useful

Claim 20; Page -; 158pp; English.

The invention describes novel nucleic acids encoding interleukin (IL) 17

Treceptor like polypeptides useful as vaccines and in gene therapy. These
receptor like polypeptides useful as vaccines and in gene therapy. These
have immunomodulatory, anti-inflammatory, anti-diabetic, anti-microbial,
tmannosuppressive, hepatic, anabolic, anti-diabetic, anti-microbial,
costeopathic, vascular, cytostatic, anti-leukaemic, anti-infertility and
cophthalmological activities. The IL-17 receptor like nucleic acids and
company be used to prevent and treat disease associated with
consider (or example immune disorders (e.g. inflammation, diabetes and
consider (e.g. anorexia, cachexia and obesity), neuronal
cyality disorders (e.g. cystic fibrosis, asthma and emphysema), skin disease
cyality disorders (e.g. cystic fibrosis, asthma and emphysema), skin disease
considers (e.g. cystic fibrosis, asthma and emphysema), skin disease
considers (e.g. cystic fibrosis, asthma and emphysema), skin disease
considers (e.g. cystic fibrosis, asthma and emphysema), skin disease
considers (e.g. cystic fibrosis, asthma and emphysema), skin disease
considers (e.g. cystic fibrosis, asthma and emphysema), skin disease
considers (e.g. cystic fibrosis, asthma and emphysema), skin disease
considers (e.g. cystic fibrosis, and hypercalcaemia), wellowed
considers cancer), reproductive disorders (e.g. leukaemia, myeloma and
considers cancer), reproductive disorders (e.g. leukaemia, myeloma
considers (e.g. strucker), and any also used as disquested probes used as
considers needing restorative therapy. The ILIPIIP may also be used as
considered in the production of antibodies against the proteins and in

The invention describes novel nucleic acids encoding interleukin (IL) 17

receptor like polypeptides useful as vaccines and in gene therapy. These
receptor like polypeptides useful as vaccines and in gene therapy. These
have immunomodulatory, anti-inflammatcory, anti-discheric, anti-nicrobial,
immunosuppressive, hepatic, anbolic, anti-lathamer's renal,
costeopathic, vascular, cytostatic, anti-lathametic, dermatological,
cototians may be used to prevent and treat diseases associated with
cototians may be used to prevent and treat diseases associated with
cototians may be used to prevent and treat diseases associated with
cototians may be used to prevent and treat diseases associated with
cototians rejection), infections (e.g. inflammation, diabetes and
cytostaticals (e.g. dystoins), infections (e.g. inflammation, diabetes and
cytostaticals (e.g. cystofic fibrosis, asthma and emphysema), skin disease
(e.g. eczema and psoriasis), kindery disease (e.g. glomerulonephritis),
cototians and psoriasis), kindery disease (e.g. leukemia, myeloma and
cototians and tits complements may also used as disquestic the presence of samilar nucleic acids in samples and identify
cytotiets the presence of samilar nucleic acids in samples and identify
cototiets and antigonists may also be used to down regulate
contigues in the production of antibodies against the proteins and an exprist.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes novel nucleic acids encoding interleukin (IL) 17 receptor like polypeptides useful as vaccines and in gene therapy. These have immunoadulatory, anti-inflammatory, controllar, cytostatic, anti-indexemic, anti-inflammatory and proteins may be used to prevent and treat disease associated with inappropriate IL-17 receptor like polypeptide (IL17rlp) expression. These include, for example immune disorders (e.g. inflammaton, diabetes and transplant respection). Infections (e.g. inflammation, diabetes and transplant respection). Infections (e.g. inflammation, diabetes and dysorders (e.g. anorexta, cacheait and obesity), neuronal dysfunction (e.g. Alzheimer's disease, Parkinson's disease and epilepsy), weight disorders (e.g. anorexta, asthma and emphysema), skin disease (e.g. stroke and atherosclerosis, cancers (e.g. jufertility and bone diseases (e.g. osteoporosis and hypercalcaemia, mysloma and breast cancer), reproductive disorders (e.g. infertility and miscaritage), eye disorders (e.g. infertility and miscaritage), eye disorders (e.g. infertility and its complements may also used as dispussed to probes to detect and quantitate the presence of similar nucleic acids in samples and identify modulators of samples against the proteins and in assays to identify modulators of empression and activity. The antiques in the production of antibodies against the proteins and in assays to identify modulators of empression and activity. The arrawainn and antivity. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              expression and activity.

Note: This sequence is not given in the specification but is based on the human interleukin 17 (IL-17) receptor like protein sequence (AAU09904) and has been created according to information given in claim 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acids encoding interleukin 17 receptor like polypeptides, useful for preventing, diagnosing and treating, e.g. leukemia, asthma, diabetes, psoriasis and glaucoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 ASRNSGLINITFRYDNCTTYLNPVGKHVIADAQNITISQYACHDQVAVTILWSPGALGIE 120

weight disorders (e.g. anorexia, cacheria and obesity), neuronal dysfunction (e.g. Alzaheimer's disease, Parkinson's disease and epilepsy), lung disorders (e.g. Alzaheimer's disease, Parkinson's disease and epilepsy), lung disorders (e.g. cystic fibrosis, askima and emphysema), skin disease (e.g. eczema and paoriasis), kidney disease (e.g. glomerulonephritis), bone diseases (e.g. oxteoporosis and hypercal camia, wascular disorders (e.g. stroke and atheroscierosis, cancers (e.g. linfertility and breast cancer); reproductive disorders (e.g. linfertility and miscarriage), eye disorders (e.g. glaucomarand retinal neuropathy). The DNA and its complements may also used as disquostic probes to detect and quantitate the presence of similar nucleic acids' in samples and identify particular the production of antibodies against the proteins and in assays to identify modulators of expression and activity. The antibodies and antagonists may also be used as anti-militing antibodies and antagonists may also be used to down regulate
                                                                                                                                                                                                                                                                              Note: This sequence is not given in the specification but is based on the human interleukin 17 (IL-17) receptor like protein sequence (AAU09904) and has been created according to information given in claim 24.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WVIQKIHESOFIIVVCSKGMKYFVDKKNYKHKGGRGSGKGELFLVAVSAIAEKLRQAKQ 480

The invention relates to primate and rodent DNAX cytokine receptor subunit (DCRS) polypeptides and the polynucleotides encoding them. The receptors, or their portions may be useful as phosphate labelling enzymes to label general or specific substrates. The subunits may also be functional immunogens to elicit recognising antibodies, or antigens capable of binding antibodies. A combination, e.g., including a DCRS can be used as an immunogen for the production of antisera or antibodies capable of distinguishing between other cytokine receptor family members. A purified DCRS can also be used as a reagent to detect antibodies generated in response to the presence of elevated levels of expression, or immunological disorders which lead to antibody production to the endogenous receptor. This sequence represents the human DCRSB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  61 ASRNSGLYNITFRYDNCTTYLNPVGKHVIADAQNITISQYACHDQVAVTILMSPGALGIE 120

The sequence is PRO20026 which is the human Interleukin 17 receptor, II-77RH4, encoded by DNA 154095-2998. A composition containing ant/agonists to the PRO polypeptides or individual components containing ant/agonists to the PRO polypeptides or individual components occidentains of teating a mammal with an immune related disease, e.g. systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, dispathic inflammatory myopathy, sjoaren's syndrome, systemic sclerosis, an idopathic inflammatory myopathy, sjoaren's syndrome, systemic vasculitis, sacrodated disbase, an autoimmune haemolytic ancents, untuoimmune the contact demanitis, an allosing mellitus, immune-mediated skin disbase, on chard femanitis, an allosing collassase or food disbase, contact demanitis, an allosing collassase or food disbase, on this ammatory demyelinating polymeuropathy. Treating a prolosi charanterious disorder comprised administering a prolosi contact demanitation associated disease, or a chronic inflammatory demyelinating polymeuropathy. Treating a prolosi contact demyeliate administ comprised administering a prolosi contact demyeliate administ an entragemental companies. Or antagonist, or antagonist to the mammal. Numerous contact demyeliate administration associated diseases. 42 RMKAAARPRICVANE-GVGPASRNSGLYNITFKYDNCTTYLNPVGKHVIADAQNITISQY 100 101 ACHDOVAVTILWSPGALGIEFLKGFRVILEELKSEGROCOOLIIADPROLNSSFKRTGME 160 Gaps 62 RASASGVPALFVSGEOGVGPASRNSGLYNITEKYDNCTTYLNPVGKHVIADAQNITISQY 8; Indels 14; 92.3%; Score 3703; DB.22; Length 728; 96.7%; Pred. (AMGE-) AMGEN INC

Jing S;

WPI; 2001-611392/70: N-PSDB; AAS16201. Nucleic acids encoding interleukin 17 receptor like polypeptides, useful for preventing, diagnosing and treating, e.g. leukaemia, asthma, diabetes, psoriasis and glaucoma

Claim 2; Fig 1; 158pp; English.

The Invention describes novel nucleic acids encoding interleukin (IL) 17

Treeptor like polypeptides useful as vaccines and in gene therapy. These

CC receptor like polypeptides useful as vaccines and in gene therapy. These

CC mave immunomodulatory, anti-inflammatory, anti-diabetic, anti-microbial,

anti-parkinsonian, anti-corvulant, anti-asthmatic, dermatological,

anti-parkinsonian, anti-corvulant, anti-asthmatic, dermatological,

CC descopathic, vascular, cytostatic, anti-leukaemic, anti-infertility and

CC proteins may be used to prevent and treat diseases associated with

CC proteins may be used to prevent and treat diseases associated with

CC proteins may be used to prevent and treat diseases associated with

CC transplant rejection, infections (e.g. inflammation, diabetes and

CL transplant rejection), infections (e.g. inflammation, diabetes and

CL transplant rejection), infections (e.g. inflammation, diabetes and

CL transplant rejection), infections (e.g. inferious), sitseamed and

CC transplant rejection, infections (e.g. inferiilty), neuropally,

CC dysfunction (e.g. Alzheimer's disease, parkinson's disease and epilepsy),

CC dysfunction (e.g. Alzheimer's disease, parkinson's disease and epilepsy),

CC dysfunction (e.g. Alzheimer's and hypercalcaemia, weelong and

CC bone diseases (e.g. osteoporosis and hypercalcaemia, weelong and

CC bone diseases (e.g. osteoporosis and hypercalcaemia, weelong

CC on diseases (e.g. osteoporosis and hypercalcaemia, weelong

CC of osteoporosis and attribodies against the proteins and in

CC osteoporosis and antibodies and antibodies against the proteins and unitarilizinal and activity. This is

The invention relates to an isolated cytokine receptor polypeptide designated Ecytori8. The Ecytori8 polypeptides can be expressed by standard recombinant methodology. The polypeptides can be used to inhibit cell proliferation associated with psoriasis or tumour growth. The encoding nucleic acids are useful for providing Ecytori8 in vivo by gene therapy techniques. Ecytori8 oilgonucleotide probes are useful for in vivo diagnosis, and the Ecytori8 probes and primers can be used to detect and localize Ecytori8 gene expression in tissue samples. The probes are also useful for in cetetching gross aberrations in chromosome 3 in which Ecytori8 gene resides. The Ecytori8 polynucleotides can also be used in linkage-based testing of pulmonary alveolar proteinosis, familial periodic fever and erythroleukemia, and erythroleukemia associated with polymorphisms of cytokine receptors. The present sequence represents a murine Ecytori8 amino acid sequence.
                                                                                                                                                                                                                                                                                                                                                    New cytokine receptor polypeptide designated zcytori8, useful for initialiting cell proliferation associated with psoriasis or tumor growth, and modulating immune system by binding to endogenous zcytori8 ligand
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              179

Title: 5.55 US-09-912-157-2 Parfect Rone 4013
Sequence: 31 NAPWIQLCSYPETYNACLNGCRADLGCRSYTDELHAVAPL.753
Scoring, table: Babos 10.0 , Gapext 0.5
Searched: 283224 seqs, 96134422 residues
Total number of hits satisfying chosen parameters: 283224
Minimum DB seq length: 0 Maximum DB seq length: 2000000000

Pred. No. 1s the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Title:
Scoring table; BLOSUM62 Gapert 0.5 Gapert 0.5
Searched: 112892 segs, 41476328 residues
Total number of hits satisfying chosen parameters: 112892
Minimum DB Seq length: 0 Minimum DB Seq Length: 2000000000000000000000000000000000000

Pred. No. 1s the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution. Post-processing: Minimum Match 10%
Maximum Match 100%
Listing first 45 summaries Database : SwissProt_40:*

J. Biol., Chem. 276.1660-1664(2001).

I. FUNCTION: Receptor for the proinfilammatory cytokines IL17B and IL17B: May play a role in controlling the growth and/or differentiation of hematopoietic cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -> VKFSELLMGGKGHRRLFHHSLLLRMSSLLSNALLPADT
                                                                                                                                                                                                                                                                                                                                                                 mostly
                                                                                                                                                                                                                                                                                           Secreted (isoform 2).

- ALTERNATIVE PRODUCTS: 2 isoforms; 1 (shown here), and 2; are sproduced by alternative splicing.
-- TISSUE SPECIFICITY: Expressed in several endocrine tissues, mostly in fetal and adult liver; kidney, pancreas, testis, colon, brain and small intestine; notidetected in peripheral blood leukocytes, lymphoid organs, and most cell lines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   232 RASYVIPVTGDSEGATYQLIPYPPTCGSDCIRHKGTVVLC---PQTGVPFPLDNNKSKPG 288

MISCELLANEOUS: EVI27 is a common site of retroviral integration in BXHZ murhoe myeloid leukemias, localized near the ILLTBR gene.
Proviral integrations result in increased expression of ILLTBR on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Secreted (isoform 2).
ALTERNATURE PRODUCTS: 2 isoforms; 1 (shown here) and 2; are produced by alternative splicing.
TISSUE SPECIFICITY: LIVER and testis. Expressed at lower level in kidney and lung. Expressed in selected T-cell, B-cell and myelold
IITS_MOUSE STANDARD; PRT; 499 AA.

-1. FUNCTION: Receptor for the proinflammatory cytokines IL17B and IL17E. May play a role in controlling the growth and/or differenciation of hematopoietic cells.

-1. SUBCELLUIAR LOCATION: Type I membrane protein (1soform 1);
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Eukaryota, Metazoa, Chordata, Craniata; Vertebrata, Euteleostomi,

Iwai K., Minato N.;

"Human SPA-1 product selectively expressed in lymphoid tissues is a
specific GPPase-activating protein for Rapl and Rap2.";

J. Biol. Chem. 273:28081-38088 (1997).

-I- FUNCTION: Gtpase activator for the nuclear ras-related regulatory
protein RAP-11, converting it to the putatively inactive
GDP-Dound state.
                                                                                                                                                                                                                                                                                                                                   -----KQEQTTETTSCLLQNVSPGDYIIELVDDTNTTRKVMHYALK---PVHSPWAGPIR 313
